X-ray examination of the breast (mammography) is believed to be one of the most accurate methods of detecting breast cancer. You should understand, however, that a mammogram is not 100% effective in detecting all breast cancers. Some cancers may be seen on an X-ray study and cannot be felt on physical examinations. Other cancers can be felt on physical examinations, but cannot be seen on the X-ray study. It is estimated that as many as 10% of cancers cannot be detected by the mammogram in certain types of breasts.

It is important that you understand these facts. If you have not has a recent physical examination prior to the mammogram, you must contact your doctor for a breast examination to complete the screening procedure.

NEGATIVE OR NORMAL MAMMOGRAM does not completely exclude the possibility of breast cancer.

I herby authorize Pacific Coast Medical Services to obtain medical records regarding my present or previous mammograms to include films, reports and biopsy findings.

I have read and understand the above and acknowledge that I have received a copy of the information.
